Summary

Senior software engineer with 7 years of experience building workflow automation systems end-to-end, from multi-threaded backend services to the React interfaces on top of them. Core developer through a successful acquisition by Nuix. Now pursuing an MEng in Electrical & Computer Engineering, focused on embedded systems.

Experience

Senior Software Engineer, Rampiva (acquired by Nuix, 2023) – Remote / Toronto Aug 2018 – Feb 2025

Core full-stack developer on a Java and React platform; reported data processing throughput gains of over 350%.

- **Front-end Architecture:** Led development of multiple React applications, including the core Automate web application. Designed a modular component library with i18next internationalization and WCAG accessibility.
- **Front-end Performance & Security:** Built virtual rendering for large datasets, Web Workers for intensive computation, localized caching, OIDC authentication and automated token refresh.
- **Multi-Threaded Service:** Designed and implemented a full-stack legal hold notification system with a multi-threaded execution engine (thread pools, stateful tasks), normalized relational schemas, SSO, M365 and LDAP user synchronization, and user-provided SMTP support.
- **Form Builder:** Spearheaded a Java-to-React form builder that uses reflection and class annotations to generate 200+ operation forms, including input lists, tables and nested object forms via recursion, significantly reducing front-end development time and maintenance.
- **Data Upload:** Architected a resumable upload system on the tus protocol using direct Java ByteBuffers, larger cache sizes and separate threads for reads, writes and file hash calculations to verify integrity after upload. Achieved stable 500 Mb/s across distant locations, with uploads of up to 1 TB and more.
- **Third-Party Integrations:** Pioneered a standardized framework for third-party integrations (abstract ORM and RESTful API resource patterns; OIDC, username and password and API key authentication; exponential back-off and rate limiting), enabling over 10 integrations including the Microsoft Purview and Google Vault collectors.
- **Testing & CI/CD:** Structured a Selenium end-to-end test suite (200+ tests) in a Jenkins CI/CD pipeline.
- **Mentorship:** Mentored junior and intermediate developers via code reviews, design debates and pairing.
- **Troubleshooting & Security:** Debugged internal and client-facing issues using network debuggers, stack traces and debug logs. Managed core code repositories and mitigated vulnerabilities identified via Snyk and Sonar.

Technical Skills

Languages: Java, JavaScript, TypeScript, Python, Rust, Go, C/C++, SQL, GraphQL, HTML/CSS, Shell

Frameworks: React, Redux, Redux-Saga, Dropwizard, Spring, Node

Cloud & DevOps: AWS, Azure, GCP, Cloudflare, Docker, Jenkins (CI/CD), Git, Snyk, Sonar

Testing & Debugging: Selenium, JUnit, Fiddler, Wireshark

Architecture: System Design, Multi-threading and Concurrency, REST API Design, OIDC / SSO Authentication, Caching, Relational Schema Design, Memory Management

Education

University of Toronto, MEng in Electrical & Computer Engineering – Toronto Sept 2026 – present

Toronto Metropolitan University, BEng in Computer Engineering – Toronto Sept 2014 – Apr 2018
